Viet Nam is ready for its close-up. On September 7, Vietnam Today, the country's first international English-language television channel, will officially go live — opening a fresh window for global audiences to experience the nation beyond the headlines. Promising more than just pretty pictures and travel clips, the channel aims to reshape perceptions by presenting a vivid, contemporary and objective view of modern Viet Nam — from its cultural heritage to its fast-evolving digital economy. Broadcasting 24/7, Vietnam Today will deliver content across television and digital platforms with multi-language subtitles tailored for each region it reaches. With a focus on quality and accessibility, the channel hopes to meet the growing demand for trustworthy, engaging coverage of Việt Nam's transformation.

Launched by national broadcaster Việt Nam Television (VTV), the channel will feature a diverse lineup: politics and current affairs in Vietnam 360 and The Point, business news in Daily Biz and culture and tourism through Culture Mosaic and Amazing Vietnam. Other shows will explore innovation, digital

transformation and environmental issues. “It will be a connecting platform to promote the national brand and image to the world,” Đỗ Đức Hoàng, deputy general director of VTV, said. “Through this, Vietnam Today contributes to expanding international cooperation, creating a bridge between Việt Nam and the global community and affirming the country’s position and **prestige** in the international arena.”

The channel aims to serve a wide international audience: policymakers and researchers seeking reliable data, investors eyeing new opportunities, tourists planning their next destination and members of the Vietnamese diaspora eager to stay connected to their homeland. Vietnam Today is designed to **challenge outdated stereotypes**. The channel will present Việt Nam as a peaceful, forward-looking and stable nation — one that proudly preserves its traditions while embracing innovation and global integration. With content grounded in accurate information and creative communication, VTV says the new service will reflect Việt Nam’s values and **its** people — youthful, resilient and ready to engage with the world.

Programming will be available across platforms including OTT (over-the-top) applications and DTT (digital terrestrial television) networks, with initial audiences in the Americas, Europe, Laos, Cambodia, and Myanmar. Starting in 2026, VTV plans to expand distribution through global partnerships and television service providers, aligning with Việt Nam’s foreign policy goals. Distribution will be adapted to suit regional broadcasting methods — from satellite and cable to IPTV, OTT, and programme exchange — to ensure content is easily and effectively delivered to viewers across borders. In the age of digital diplomacy, Vietnam Today marks a timely and strategic step for the country, placing Việt Nam’s story in its own voice on the global stage — a story of resilience, culture and connection.

Read the following passage about understanding Climate change through Proxy records and mark the letter A, B, C or D on your answer sheet to indicate the best answer to each of the following questions from 49 to 58.

One of the biggest challenges in determining whether recent climate events reflect human impact is understanding the natural variability of the climate. We know that over the course of history, the climate has undergone significant changes without human intervention. The global climate system is also incredibly complex, with many interconnected factors, which means it can fluctuate in unpredictable ways. To accurately assess whether recent climatic changes stem from natural processes or anthropogenic factors, it is essential to first **delineate** the extent to which the climate can naturally vary.

Unfortunately, instrumental climate records only cover about a century, which is too short to provide a reliable measure of long-term climate variability. However, when we look at longer timescales, we see clear evidence of slow shifts between different climate regimes. To go further back in time and build a clearer picture of past climate fluctuations, scientists turn to proxy records.

Proxy records are derived from substances whose physical and chemical properties change in response to **prevailing** climatic conditions during the time of their deposition. These substances - like ice cores, ocean sediments, and tree rings - form layers, often annually, providing a continuous record of changes over hundreds or even thousands of years. (I) By analyzing **these records**, scientists can infer past temperatures, rainfall patterns, and other climate-related data. (II) For example, temperature reconstructions have been made from Greenland ice cores, sediments from European lakes, and ice cores from both Peru and Antarctica. (III) While these records generally show global temperature variations, they also reveal significant regional differences, indicating that climate patterns can vary across different parts of the world. (IV)

These proxy records clearly show that the climate has experienced considerable natural variability over periods longer than a few thousand years. At the same time, the relative stability of the climate over the last 10,000 years - known as the Holocene period - stands out.

By offering a glimpse into the climate's natural variability, proxy records provide an invaluable benchmark for understanding how natural processes have historically interacted to shape the global climate. These processes include chaotic atmospheric shifts, the erratic behavior of ocean currents, and variations in land surfaces, ice, and snow cover. Additionally, the proxy data capture fluctuations resulting from volcanic and solar activity, as well as the potential contribution of human influences.

To better understand how these processes interact, scientists use computer models to simulate global climate patterns. While these models are useful, they can only capture part of the complexity of the climate system and often provide a limited view of natural variability. In fact, studies suggest that current climate models show much less variability than what is observed in proxy data, indicating that these models may not fully reflect the range of natural climate fluctuations.
