Scientists are still wondering what planets in outer space might support life. To support human life, a planet needs to meet three main conditions. Firstly, it must have liquid water. Secondly, the temperature must not be too high or too low. Finally, the planet needs to have a suitable size so that its gravity is strong enough to hold an atmosphere around it.

According to scientists, Mars is one of the most promising planets for life in our solar system. Its days last for 24.5 hours, which is similar to Earth's. However, the climate on Mars is unsuitable for humans because it is too cold and lacks oxygen. Although scientists have found some **traces** of water on its surface, humans still cannot live there without special equipment.

28. What is the first condition for a planet to support life?

- A. It must have a lot of gold.
- B. It must have liquid water.
- C. It must be very far from the sun.

29. Why is gravity important for a habitable planet?

- C. It makes the planet look bigger.

30. How long does a day last on Mars?

- A. 24.5 hours B. 12 hours C. 48 hours

31. Why can't humans live on Mars now?
